THE CLAIMS DEFINING THE INVENTION ARE AS FOLLOWS:

. . . . Y

- 1. A method for selectively enriching for a microorganism able to metabolise a test substrate, and/or the enrichment of an enzyme involved in the metabolism of the test substrate, the method comprising the steps of
 - a) providing a population of microorganisms in a vessel,
- b) feeding fluid into the vessel at a controlled flow rate commencing with an initial flow rate, the fluid comprising a nutrient medium and, for at least part of the feed period, the test substrate,
 - c) producing a signal indicative of the level of a metabolism indicator which is a terminal electron acceptor, over the time-frame of the enrichment, wherein the signal is produced from a probe that takes a reading in the vessel, and
 - d) providing an output showing the change in level of the metabolism indicator which is based on the signal of the probe to enable assessment of selective enrichment of a microorganism that metabolises the test substrate, and/or the enrichment of an enzyme produced by the microorganism that is involved in the metabolism of the test substrate.
- 2. The method of claim 1, wherein the output is produced electronically directly from the signal, such that the output is provided on-line.
- 3. The method of claim 1 or claim 2, wherein the method further comprises presetting conditions to be met by the signal output to result in a change in the fluid flow rate, and changing the flow rate at which fluid is fed into the vessel when the conditions are met, wherein the preset conditions are a combination of a predetermined period of time and a preset value range within which the signal must remain for the predetermined period of time.
